

Structural Fingerprint → Pharmacological Activity Profile

X = residue interaction fingerprint

y = pharmacological activity database

Diazepam

$\alpha 1$ block
27 features

$\alpha 2$ block*
27 features

$\alpha 1\beta 2\gamma 2$ Ki: 14 nM
 $\alpha 2\beta 2\gamma 2$ Ki: 20 nM
Functional potency / efficacy: NA

Alprazolam

$\alpha 1$ block
27 features

$\alpha 2$ block*
27 features

$\alpha 1\beta 2\gamma 2$ Ki: 0.8 nM
 $\alpha 2\beta 2\gamma 2$ Ki: 0.6 nM
Functional potency / efficacy: NA

Data linkage only — no model trained (n = 2 drugs)

Primary axis: different drugs within each receptor block. $\beta 3$ structure ↔ $\beta 2$ pharmacology: context_mismatch.

* $\alpha 2$ is a provisional local construct. Geometry NA is retained; X blocks are concatenated, never averaged.
